124. Read the passage and answer the given question There seems to be no chilly distance existing between the German students and the professor, but, on the contrary, a companionable intercourse, the opposite of chilliness and reserve. When the professor enters a beer hall in the evening where students are gathered together, these rise up and take off their caps and invite the old gentleman to sit with them and partake. He accepts, and the pleasant talk and the beer flow for an hour or two, and by and by the professor, properly charged and comfortable, gives a cordial good night, while the students stand bowing and uncovered, and then he moves on his happy way homeward with all his vast cargo of learning afloat in his hold. Nobody finds fault or feels outraged. No harm has been done. What does the author mean by the phrase "no chilly distance"?
- (a) The weather is not very chilly
 (b) in Germany. The professor being very strict scares the students quite a few times as in the beer hall.

49. (b) An oxygen-helium mixture is used for artificial respiration in deep sea diving instead of air because nitrogen present in air dissolves in blood under high pressure when sea diver goes into deep sea. When he comes to the surface nitrogen bubbles out of the blood due to decrease in pressure, causing pain. This disease is called "bends".

105. (b)

嘴 $\delta \times \blacklozenge \acute{Y}$

嘴 $\S \times \blacklozenge \blacklozenge \acute{Y}$

On integrating, we get

$$x - \frac{y^2}{2} + \frac{1}{2} \ln t = c, \quad t = \sqrt{x^2 + y^2}$$

$$\text{or } x - \frac{y^2}{2} + \frac{1}{3} x^2 + y^2 = c$$

113. (c) Since $x \frac{dy}{dx} - y = x^3$

$$\frac{dy}{dx} - \frac{y}{x} = x^2$$

Hence

$$IF = e^{\int -\frac{1}{x} dx} = e^{-\log x} = \frac{1}{x}$$

114. (b) $P(A) = 1/4, P(A/B) = 2/3, P(B/A) = 2/3$

By conditional probability,

$$P(A \cap B) = P(A) P(B/A) = P(B) P(A/B)$$

$$\Rightarrow \frac{1}{4} \cdot \frac{2}{3} = P(B) \cdot \frac{1}{2} \Rightarrow P(B) = \frac{1}{3}$$

115. (d) We have, $f(x) = 2x - 3, g(x) = x^3 + 5$
 $(f \circ g)(x) = f(g(x)) = 2(x^3 + 5) - 3 = 2x^3 + 7$
 Let $y = (f \circ g)(x) = 2x^3 + 7$

$$\Rightarrow x = \sqrt[3]{\frac{y-7}{2}} \Rightarrow \frac{dx}{dy} = \frac{1}{2\sqrt[3]{y-7}}$$

116. (c) The inverse of the proposition $(p \rightarrow \sim q)$

$$\sim (p \rightarrow \sim q) \Leftrightarrow \sim p \vee \sim (\sim q) \Leftrightarrow \sim p \vee q$$

117. (d) (i) $f(x) = \sqrt{x}$ is continuous in $[4, 9]$

(ii)

$$f'(x) = \frac{1}{2\sqrt{x}}$$

Thus $f(x)$ is differentiable in $(4, 9)$

(iii) $f(4) \neq f(9)$. All the three conditions of the theorem satisfied then there exist at least one $c \in (4, 9)$ such that.

$$f'(c) = \frac{f(b) - f(a)}{b - a} \Rightarrow \frac{1}{2\sqrt{c}} = \frac{1}{5} \Rightarrow c = \frac{25}{4}$$

118. (b) We have

$$|x-1| = \begin{cases} x-(x-1) = -2x+1, & \text{if } x \leq 0 \\ x-(x-1) = 1, & \text{if } 0 < x < 1 \\ x+(x-1) = 2x-1, & \text{if } x \geq 1 \end{cases}$$

$$\int_{-1}^3 |x-1| dx = \int_{-1}^0 (-2x+1) dx + \int_0^1 1 dx + \int_1^3 (2x-1) dx$$

$$= \left[-x^2 + x \right]_{-1}^0 + \left[x \right]_0^1 + \left[x^2 - x \right]_1^3 = 0 + 1 + (9 - 2) = 8$$

119. (c) a, b, c are in A.P. $2b = a + c$

Now,

$$e^{1/c} e^{1/a} e^{(a+c)/ac} = e^{2b/ac} e^{b/ac} = e^{3b/ac}$$

$$\left\{ e^{1/c}, e^{1/a}, e^{(a+c)/ac} \right\} \text{ in G.P. with common ratio } e^{b/ac}$$

$$= \frac{e^{b/ac}}{e^{1/c}} = e^{(b-a)/ac} = e^{d/(b-d)(b+d)}$$

$$= e^{d/(b^2-d^2)}$$

[Q a, b, c are in A.P. with common difference $d \Rightarrow b - a = c - b = d$]

120. (a) We have $T = 14a^2$

$$\Rightarrow {}^nC_n \left(a^{1/3} \right)^n \left(a^{2/3} \right)^{n-1} = 14a^2$$

$$\Rightarrow n a^{1/3 + 2(n-1)/3} = 14a^2 \Rightarrow n = 14$$

$$\frac{{}^nC_n}{{}^nC_4} = \frac{{}^nC_3}{{}^nC_2} = \frac{12}{3} = 4$$

$$\frac{C}{2} = \frac{1}{4} \frac{C}{2}$$
